

## Bella Casa- Orphanage Management System

Bella Casa orphanage management system is a solution to OMS problem statement provided to us at Infosys Hackathon 2017.

This project includes a web application coded in – HTML5, CSS3, BOOTSTRAP, JAVASCRIPT, JQUERY and PHP.

The database connection codes include – MySQLi Procedural connections which are not hosted at a given site with a defined username. Once the project is in the deployers' hand, the final database areas of localhost are needed to be converted into the server name given to that particular domain.

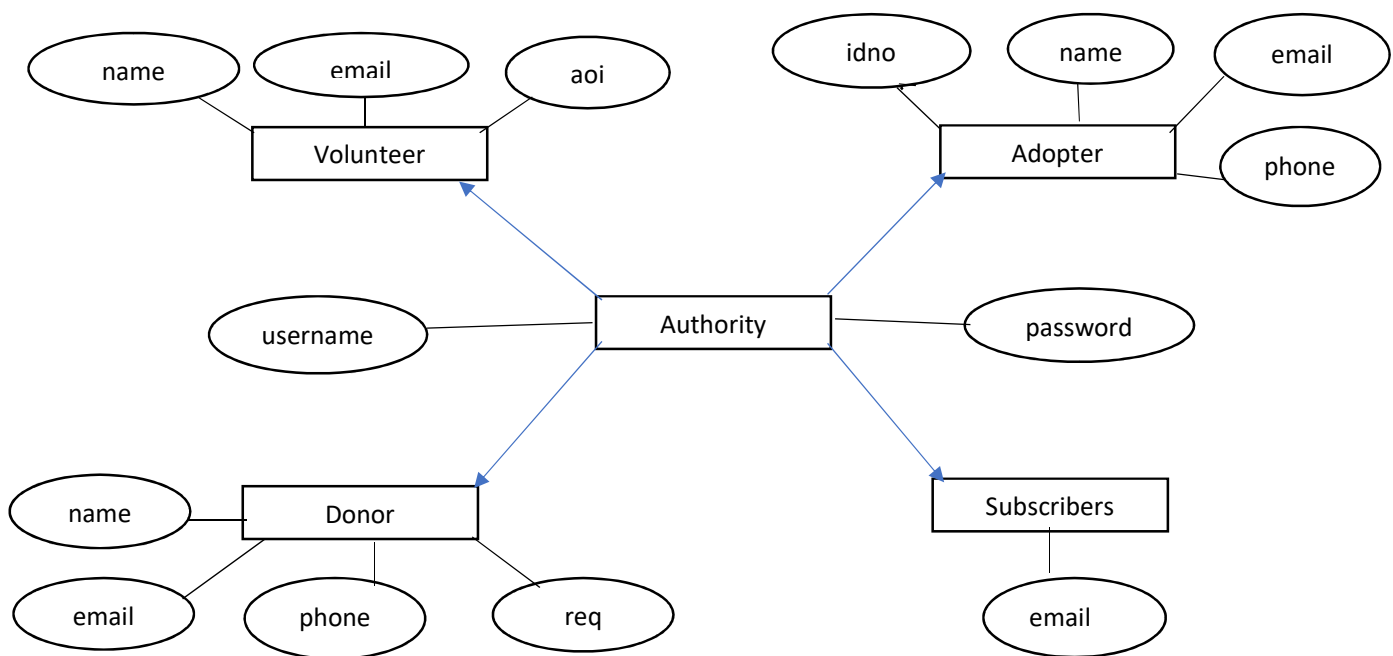

The files included in CSS folder – Hold the entire css for the project.

Similarly, separate folders have been made for collection of different files.

*The authority has been given a password and a username in person to operate the system parts.*

**The html file index.html is the prime of all.**

The database structure is as shown:[aoi- area of interest]

Here, :[aoi- area of interest]

*We assume that a database manager and a web-developer is hired when the deployment takes place so as to ensure the structuring of database along with server additions correctly.*

Download this zip file and run index.html in your web browser. For database functionality – Change the servername and root password in the file – db\_connection.php
